McWethy et al. 10.1073/pnas.1011801107

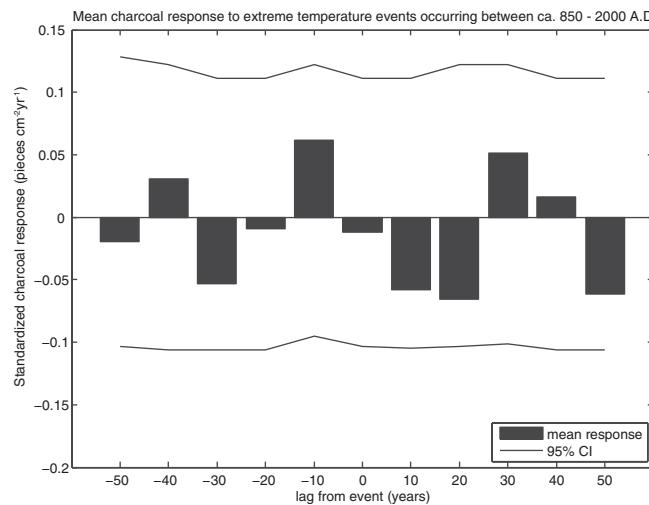

Fig. S1. Superposed epoch analysis (SEA) examining mean charcoal accumulation rates relative to extreme summer temperature events. Bars represent mean standardized charcoal accumulation rates (CHAR pieces $\text{cm}^{-2} \text{yr}^{-1}$) in the composite record during decades with extreme summer temperature events (year 0, >95% C.I. of mean temperatures from *circa* A.D. 850–2000) and for five decades prior to and after extreme temperature events. Summer temperature reconstruction is derived from silver pine (*Lagarostrobus colensoi*) tree-ring chronologies and calibrated with instrumental data (1, 2). Mean CHAR levels did not exceed 95% C.I. Confidence intervals represent the 2.5th and 97.5th quartile when repeating the SEA 1,000 times using randomly shifted temperature event series.

Table S1. Site locations and climate data derived from 30 y (1950–1980) mean climate observations

Site	Elevation, m	Latitude, °south	Longitude, °east	Mean annual temperature, °C	Precipitation (mm/y)	Annual water deficit, mm
Diamond Lake	380	44.65	168.96	10.10	980	90
Glendhu Lagoon	280	44.66	169.05	10.10	896	114
Lake Kirkpatrick	570	45.03	168.57	8.00	1077	26
Lake Te Aroha	290	45.33	167.80	9.10	1311	0
Lake Thomas	490	45.47	167.95	8.30	1109	5
Lake Sarah	570	43.05	171.78	9.10	1154	26
Lake Letitia	600	43.05	171.95	8.70	1086	49
Blackwater Lake	680	43.12	171.92	8.60	1096	44
Lagoon Saddle	1170	43.05	171.60	5.80	2292	0
Horseshoe Lake	460	42.60	172.52	9.70	968	95
Lewis Pass	860	42.38	172.40	7.70	2599	0
Dingle Burn	370	44.44	169.38	10.00	1075	56
Duke's Tarn	830	44.96	168.49	6.70	1342	0
Lake Johnson	390	45.00	168.73	9.50	739	165
Travis Swamp	5	43.42	172.70	11.90	591	285
Pomahaka	845	45.51	169.25	6.40	1029	0

Climate data were derived from mathematical analysis of long-run average weather station data by Land Environments of New Zealand (1). Annual water deficit (mm) is the sum of monthly amounts in which evaporation exceeds rainfall (1).
